

ABSTRACT OF DISCLOSURE

The resin molding machine is capable of executing many functions and easily expanding and modifying the structure. In the resin molding machine, a loader and an unloader are moved on common rail sections so as to convey a work piece and a molded product. An additional rail unit has a rail section, on which the loader and the unloader can be moved. The additional rail unit is detachably attached between a work piece feeding unit and a product accommodating unit. The common rail sections and the rail section of the additional rail unit are disconnectably connected.
